3.3 Axial Direction

The coordinate system used for attitude angle settlement is the northeast sky coordinate system. Place the module in the positive direction, as shown in the figure below, direction right is the X-axis, the direction forward is the Y-axis, and direction upward is the Z-axis. Euler angle represents the rotation order of the coordinate system when the attitude is defined as Z-Y-X, that is, first turn around the Z-axis, then turn around the Y-axis, and then turn around the X-axis.

5 Communication Protocol

Level: TTL level

Baud rate: 4800, 9600 (default), 19200 38400, 57600, 115200, 230400, 460800, 921600, stop bit and parity

5.1 Output Data Format

5.1.1 Time Output

0x55	0x50	YY	MM	DD	hh	mm	ss	msL	msH	SUM
------	------	----	----	----	----	----	----	-----	-----	-----

YY: Year, 20YY Year

MM: Month

DD: Day

hh: hour

mm: minute

ss: Second

ms: Millisecond

Millisecond calculate formula:

$ms = ((msH < 8) | msL)$

$Sum = 0x55 + 0x51 + YY + MM + DD + hh + mm + ss + ms + TL$

5.1.2 Acceleration Output

0x55	0x51	AxL	AxH	AyL	AyH	AzL	AzH	TL	TH	SUM
------	------	-----	-----	-----	-----	-----	-----	----	----	-----

Calculate formula:

$$a_x = ((AxH < 8) | AxL) / 32768 * 16g \text{ (g is Gravity acceleration, } 9.8m/s^2)$$

$$a_y = ((AyH < 8) | AyL) / 32768 * 16g \text{ (g is Gravity acceleration, } 9.8m/s^2)$$

$$a_z = ((AzH < 8) | AzL) / 32768 * 16g \text{ (g is Gravity acceleration, } 9.8m/s^2)$$

Temperature calculated formula:

$$T = ((TH < 8) | TL) / 100 \text{ } ^\circ C$$

Checksum:

$$Sum = 0x55 + 0x51 + AxH + AxL + AyH + AyL + AzH + AzL + TH + TL$$

Note:

1. The data is sent in hexadecimal, not ASCII code.

Each data is transmitted in turn of low byte and high byte, and the two are combined into a signed short type data.

For example, X-axis acceleration data Ax, where AxL is low byte and AxH is high byte. The conversion method is as follows:

Assuming that Data is actual data, DataH is its high byte, and DataL is its low byte, then: Data = (short) (DataH < 8 | DataL).

It must be noted that DataH needs to be coerced into a signed short data and then shifted, and the data type of Data is also a signed short type, so that it can represent negative numbers.

5.1.3 Angular Velocity Output

0x55	0x52	wxL	wxH	wyL	wyH	wzL	wzH	TL	TH	SUM
------	------	-----	-----	-----	-----	-----	-----	----	----	-----

Calculated formula:

$$w_x = ((wxH < 8) | wxL) / 32768 * 2000(^{\circ}/s)$$

$$w_y = ((wyH < 8) | wyL) / 32768 * 2000(^{\circ}/s)$$

$$w_z = ((wzH < 8) | wzL) / 32768 * 2000(^{\circ}/s)$$

Temperature calculated formula:

$$T = ((TH < 8) | TL) / 100 \text{ } ^\circ C$$

Checksum:

$$Sum = 0x55 + 0x52 + wxH + wxL + wyH + wyL + wzH + wzL + TH + TL$$

5.1.4 Angle Output

0x55	0x53	RollL	RollH	PitchL	PitchH	YawL	YawH	VL	VH	SUM
------	------	-------	-------	--------	--------	------	------	----	----	-----

Calculated formula:

Roll(X axis) $Roll = ((RollH < 8) | RollL) / 32768 * 180(^{\circ})$

Pitch(Y axis) $Pitch = ((PitchH < 8) | PitchL) / 32768 * 180(^{\circ})$

Yaw(Z axis) $Yaw = ((YawH < 8) | YawL) / 32768 * 180(^{\circ})$

Version calculated formula:

Version $= (VH < 8) | VL$

Checksum:

Sum $= 0x55 + 0x53 + RollH + RollL + PitchH + PitchL + YawH + YawL + VH + VL$

Note:

1. The coordinate system used for attitude angle settlement is the northeast sky coordinate system. Place the module in the positive direction, as the figure shown in Chapter 3.3, direction right is the X-axis, the direction forward is the Y-axis, and direction upward is the Z-axis. Euler angle represents the rotation order of the coordinate system when the attitude is defined as Z-Y-X, that is, first turn around the Z-axis, then turn around the Y-axis, and then turn around the X-axis.
2. Although the range of the roll angle is ± 180 degrees, in fact, since the coordinate rotation sequence is Z-Y-X, when expressing the attitude, the range of the pitch angle (Y-axis) is only ± 90 degrees, and it will change to less than 90 after exceeding 90 degrees Degrees while making the X-axis angle greater than 180 degrees. For detailed principles, please Google Euler angle and posture-related information.
3. Since the three axes are coupled, they will show independent changes only at small angles, and the attitude angles will change at large angles. For example, when the Y-axis is close to 90 degrees, even if the attitude only rotates around the Y-axis, the angle of the axis will also change greatly, which is an inherent problem with Euler angles indicating attitude.

5.1.5 Magnetic Output

0x55	0x54	HxL	HxH	HyL	HyH	HzL	HzH	TL	TH	SUM
------	------	-----	-----	-----	-----	-----	-----	----	----	-----

Calculated formula:

Magnetic(x axis) $H_x = ((H_{xH} \ll 8) | H_{xL})$

Magnetic(y axis) $H_y = ((H_{yH} \ll 8) | H_{yL})$

Magnetic(z axis) $H_z = ((H_{zH} \ll 8) | H_{zL})$

Temperature calculated formula:

$T = ((TH \ll 8) | TL) / 100^{\circ}\text{C}$

Checksum:

$\text{Sum} = 0x55 + 0x53 + H_{xH} + H_{xL} + H_{yH} + H_{yL} + H_{zH} + H_{zL} + TH + TL$

5.1.6 Data Output Port Status

0x55	0x55	D0L	D0H	D1L	D1H	D2L	D2H	D3L	D3H	SUM
------	------	-----	-----	-----	-----	-----	-----	-----	-----	-----

Calculated formula:

$D0 = (D0H \ll 8) | D0L$

$D1 = (D1H \ll 8) | D1L$

$D2 = (D2H \ll 8) | D2L$

$D3 = (D3H \ll 8) | D3L$

Note:

Analog input port mode:

$U = D_{x\text{Status}} / 1024 * U_{\text{vcc}}$

U_{vcc} is the power supply voltage of the module, because the module has LDO, if the module power supply voltage is greater than 3.5V, U_{vcc} is 3.3V.

If the module supply voltage is less than 3.5V, U_{vcc} equal to the supply voltage minus 0.2V

Digital input mode:

Voltage level is high, the data is 1,

Voltage level is low, the data is 0.

Digital output mode:

Output is high, the data is 1.

Output is low, the data is 0.

PWM output mode:

When the port is set to PWM output mode, port status data indicates high level width, the unit is "us".

5.1.7 Atmospheric Pressure and Height Output

0x55	0x56	P0	P1	P2	P3	H0	H1	H2	H3	SUM
------	------	----	----	----	----	----	----	----	----	-----

Calculated formula:

Atmospheric pressure $P = ((P3 \ll 24) | (P2 \ll 16) | (P1 \ll 8) | P0)$ (Pa)

Height $H = ((H3 \ll 24) | (H2 \ll 16) | (H1 \ll 8) | H0)$ (cm)

Checksum:

Sum = 0x55 + 0x56 + P0 + P1 + P2 + P3 + H0 + H1 + H2 + H3

5.1.8 Longitude and Latitude Output

0x55	0x57	Lon0	Lon 1	Lon 2	Lon 3	Lat0	Lat 1	Lat 2	Lat 3	SUM
------	------	------	-------	-------	-------	------	-------	-------	-------	-----

Calculated formula:

Longitude Lon = $((Lon\ 3 \ll 24) | (Lon\ 2 \ll 16) | (Lon\ 1 \ll 8) | Lon\ 0)$

In NMEA0183 standard, GPS output format is ddmm.mmmmm (dd for the degree, mm.mmmmm is after decimal point), the module removes the decimal point during output, so the degree of longitude can be calculated as follows:

dd = Lon / 100000000;

mm.mmmmm = (Lon % 100000000) / 100000; (% calculate Remainder)

Latitude Lat = $((Lat\ 3 \ll 24) | (Lat\ 2 \ll 16) | (Lat\ 1 \ll 8) | Lat\ 0)$ (cm)

In NMEA0183 standard, GPS output format is ddmm.mmmmm (dd for the degree, mm.mmmmm is after the decimal point), the module removes the decimal point during output, so the degree of latitude can be calculated as follows::

dd = Lat / 100000000;

mm.mmmmm = (Lat % 100000000) / 100000; (% calculate Remainder)

Checksum:

Sum = 0x55 + 0x57 + Lon 0 + Lon 1 + Lon 2 + Lon 3 + Lat 0 + Lat 1 + Lat 2 + Lat 3

Note: This only applies to devices with GPS module (WTGAHRS1, WTGAHRS2)

GPS Height= ((GPSHeightH<<8)| GPSHeightL)/10 (m)

GPS Yaw=((GPSYawH <<8)| GPSYawL)/10 (°)

GPSV = (((GPSV 3<<24)| (GPSV 2<<16)| (GPSV 2<<8)|GPSV0)/1000(km/h)

6.1 IIC Write the Module

When IIC write the module, the format is as below:

IICAddr<<1	RegAddr	Data1L	Data1H	Data2L	Data2H
------------	---------	--------	--------	--------	--------	-------

First IIC host sends a Start signal to WT901 module, then write IICAddr to register address and then write RegAddr, write the Data1L Data1H Data2L Data2H Sequentially, when the last data has been written, the host sends a stop signal to the module to release the IIC bus.

When finish writing the data, the register will be updated and module will execute the order. At the same time, the address of the module will add 1 automatically. The address Pointer will point to next address. So it can be written Continuously.

For example:

Set D0 as Digital output high

RegAddr :0x0e DataL:0x02 DataH:0x00

Logic Analyzer captures waveforms as shown below:

Register set up by the module approach is consistent with the serial protocol, please refer 6.1

6.2 IIC Read the Module

IIC read the module, the format is as follow

IICAddr<<1	RegAddr	(IICAddr<<1) 1	Data1L	Data1H	Data2L	Data2H
------------	---------	----------------	--------	--------	--------	--------	-------

First IIC host sends a Start signal to WT901 module, then write IICAddr to register address, then IIC host sends a read signal(IICAddr<<1)|1 to WT901 module, if the IIC address is 0x50(default), then the host send 0xa0

Thereafter the module will export the data follow the rule: low byte first, high byte Sequentially. The host will make SDA bus low after receiving each byte, and sends a response signal to the module. After the specified number of data has been received completely, the host stop sending response signal back to the module, then the module will stop export data. The host send a stop signal to end this operation.

For example:

Read the Angle of the module,

RedAddr: 0x3d, read 6 bytes continuously, the logic analyzer captures waveforms as shown below:

Start reading out data from 0x3d, the data is 0x9C, 0x82, 0x28, 0xFF, 0xE6, 0x24. That means X-axis angle is 0x829C, Y-axis angle is 0xFF28, Z-axis angle is 0x24E6. According to section 5.1.4, X axis angle is -176.33 °, Y-axis angle is -1.19 °, Z-axis angle is 51.89°
